

NEW ABSTRACT

A reproduction device ~~(200)~~ is arranged to conditionally block the reproduction of a particular content item ~~(324)~~. The reproduction device has a an obtaining unit (202) to obtain a content reference identifier ~~(330)~~ identifying the particular content item ~~(324)~~ and a storage unit ~~(204)~~ for storing the content reference identifier ~~(330)~~. A resolution process regularly checks on the basis of the content reference identifier ~~(330)~~ whether the particular content item is scheduled to be available, e.g. is scheduled for broadcast. When the scheduled broadcast of the particular item has been established, a blocking unit ~~(210)~~ blocks the reproduction device for that scheduled broadcast.
